Committee: United Nations Human Rights Council (UNHRC)

Topic: The Question of Addressing the Human Rights Implications of Generative AI through Combating Deepfakes and Digital Violence

Student Officer: Jung Yewon

Position: Deputy Chair of UNHRC

Introduction

The rapid development of generative AI has completely reshaped the digital landscape. The development of AI has brought significant efficiency and utility such as discovering innovative drugs and treatments and developing technological solutions that were not previously possible to fabricate. AI also contributes to personalizing products and services to suit individual needs and preferences of users, which enhances customer experience and opens up new markets that lead to innovation. AI will be used in fields of global economy as well as the field of climate change mitigation and sustainable resource management. Emerging trends like multimodal AI, stronger virtual assistants, and ethical considerations are shaping how AI will continue to evolve and integrate into businesses and daily life.

The idea of AI has been around for a long time. But for many decades, it was reserved for the realms of science fiction. However, the work of Alan Turing in the 1950s and many other great minds that followed gradually led to the rise of machine learning and the development of genuine AI solutions. This all culminated with the so-called AI boom that became most prominent in 2022, as large language models and AI chatbots, like ChatGPT, were released for public usage. Since then, AI has taken off, with many businesses embracing the tech in exciting, innovative ways.

However, the dark side of AI has to be encountered as well. There have been problems related to data privacy concerns, bias in AI models, ethical concerns, and mainly the crisis of digital violence and deepfakes that happens on online platforms. These advancements in technology make it possible to create fake images by inserting a person’s face onto another person's body, or cloning another's voice to induce unauthorized fund transfers, as well as spreading false information through deepfake

videos putting the world in chaos, creating serious situations that have never occurred before in the previous generation.

The global committee has been aware of this issue and been tackling digital violence by many means. The UNCC(United Nations Convention against Cybercrime) adopted by the UN General Assembly, first established a legally binding international framework addressing cyber crimes fostering cooperation among international law enforcement bodies. UN Women has also stated a global standard for digital safety and AI governance preventing misuse of AI. However, as AI technology is a rapidly emerging field the problems occurring from this have not been dealt with properly compared to other issues like crimes of drugs or gender-based discrimination.

UN Convention against Cybercrime Signing Ceremony officially opens in Hanoi (Socialist Republic of Vietnam Ministry of Public Security, 2025)

Definition of Key Terms

Artificial Intelligence

In the simplest of terms, AI is the branch of computer science dedicated to creating machines that are able to think like humans. AI has the capacity to comprehend, react, and translate human language into computers. The key components of AI can be broken down to data and algorithms. Many sets of data are combined and trained throughout the systems allowing the AI to learn and grow by the datasets that have been accumulated, without the need for code updates every time.

Digital Violence

Digital Violence refers to any act of aggression, harassment, and harm that has been committed to an individual or a group of people through digital platforms, technologies, and communication tools. Unlike physical footprints that fade over time, online forms of violence can never be erased entirely. Once an abusive video or image is posted online, it can be screenshotted, downloaded, or even re-uploaded causing a perpetual cycle of trauma for the victims.

Synthetic Media

Synthetic media is a digital content that is visible in different media formats that has been produced automatically or artificially. Synthetic media often refers to the usage of generative AI that can be used to produce contents like deepfakes.

Deepfake

Deepfake refers to videos or sound recordings that replace someone's face or voice with somebody else that appears like a real person is saying or doing something that they never did.

Technology-Facilitated Gender-Based Violence (TFGBV)

Technology-facilitated Gender-based Violence is an act of violence perpetrated by one or more individuals that is committed by the use of information and communication technologies or digital media against a person on the basis of gender.

Non Consensual Synthetic Intimate Imagery(NSII)

Non consensual synthetic intimate imagery refers to the term of digitally manipulating or generating images, faces, bodies and the voices of real people without their permission, creating harmful contents that can negatively affect the person's life. NSII isn't always created through advanced technology skills. It can be created by editing the image and putting different parts together, adding face filters or even changing the speed of videos (known as shallow fakes).

AI Voice Cloning

AI voice cloning is the use of AI and machine learning to create a digital replica of someone's voice. After training the model, the users can synthesize the voice with text to speech. Identity theft is the crux of the matter of voice cloning deceiving others to gain access to personal accounts, fabrication, or panic driven social engineering. A global concern of this issue is that impersonators might mimic government officials to access the biometric system to access information illegally.The action of cloning somebody's voice without clear approval can contravene their privacy rights and violate the laws against fraud.

Disinformation

Disinformation refers to false or misleading information that is purposely spread to deceive others, changing the public's opinion on a certain topic. It is different from misinformation, which is sharing false information by mistake. Fake news can be seen to be a form of disinformation that imitates real news but encompasses misleading and false statements, intentionally made to deceive the public and attract attention to get more clicks for financial gains, which then rapidly spread through the online platforms reaching more and more people. In other cases, some create deepfake videos of a certain candidate and spread it on the internet maneuvering votes or falsifying reports in conflict-zones swaying the public.

Cyber Stalking

Cyber stalking refers to any kinds of actions using digital technology to track and harass someone through online spaces. Behaviours like continuously sending and posting unwanted sexual or offensive content, cyber harassment, cyber spying, e-stalking, and violent comments. Monitoring someone's movements through location technologies(GPS) which are built into the operating systems of the smartphones and fitness apps or by hacking the victims' phone and following or contacting someone across multiple online accounts so they don't know the identity of the stalker. Cyber stalking is often accompanied by offline stalking and it can lead to physical danger.

Doxxing

Doxxing refers to intentional and unauthorized publication of an individual's private identifying information on the internet with the intention to cause harm. A common technique that is used is fake signups for mail subscriptions, food deliveries, bombarding the address with letters, or through swatting. A hacker may obtain an individual's dox without making the information public or a hacker may harvest a victim's information to break into their internet accounts or take over their social media accounts.

Social Engineering

Social engineering is the psychological manipulation of individuals to divulge information or into revealing sensitive data that breach security. It exploits human psychology tricking people to reveal sensitive information making them transferring money or granting access to restricted systems.

International Binding Framework

International Binding Framework is a legally enforceable treaty or convention signed by different nations. It sets basic rules or goals for global issues like human rights and climate change.

Background Information

The Rapid Advancement of Artificial Intelligence

Manipulated imagery has been around for over centuries, but deepfakes have elevated it to a point where reality and deception has become indistinguishable. The term deepfake originated in 2017 to depict audio and videos manipulated with the guidance of artificial intelligence to resemble a real person even when the person portrayed did not say or do what is depicted in the content. Deepfakes are a subset of synthetic media which include audio, images, text and video content created with the assistance of AI. There continue to be conversations about how to differentiate synthetic audiovisual content from deepfake audiovisual content. Clearly defining the boundaries of these concepts are still in progress, but it is an essential requirement that is needed for shaping future regulations.

The number of deepfakes online increased from 2022 to 2023. While some skeptics question the link to which harm can be directly traced to manipulated media, there is certainly some evidence of it in countries such as Slovakia, the United Kingdom and the United States. This is especially alarming amid a record breaking number of national elections that was held in 2024 and as broader global concerns grow about threats to the overall stability of a country. For instance, in March of 2022, somebody created deep fake content of the Ukrainian President falsely ordering his country's military to surrender. Seen above, as technological innovations advance, deepfakes are rapidly becoming easier to make and more persuasive.

In recent years, Artificial Intelligence has continuously evolved at an incredibly fast speed. One of the main factors for this rapid growth is Large Language Models(LLMs), Generative Adversarial Networks(GANs), and Diffusion models. This form of technology allows machines to generate human-like texts, images, and even hyper realistic audio. Nowadays, with even minimal understanding of the tools, anyone can effortlessly produce high quality content they want.

AI has brought many benefits that changed our lives. The first is the maximization of productivity and efficiency. AI drastically reduces time spent on drafting, coding, and analysing data. For instance, AI accelerates drug discovery and enhances early disease diagnosis through advanced medical imaging analysis. It also lowers learning barriers offering personalized AI assistance

matching each individual's needs. Lastly, AI enables early detection of disease outbreaks on a global scale, reducing time and alerting international public health responses.

However, the rising technology of AI has also brought up new challenges our world has never faced. There have been severe human rights violations caused by deepfake pornography and illegal media creation, as well as scams using voice cloning. Not only does AI generate false information but it also reinforces racial discrimination, gender based bias, and cultural prejudice by training AI with biased data. Global issues such as the technology gap in developed countries and developing countries are worsening the situation.

Gender-Based Online Violence

The misuse of synthetic media is altering technological tools into structural violence, creating new forms of abuses and imposing threats to human dignity. AI enables the creation of deepfakes impersonating others. Platforms such as Tiktok and Instagram collect image and video data, which are then manipulated into non-consensual explicit content through deepfake technology and create deepfake pornography. TFGBV (short for Technology facilitated gender based violence) has no limits or geographical boundaries. This form of digital violence often starts on digital platforms then escalates to physical environments. It is found that many women are experiencing severe mental health impacts, such as anxiety, severe depression, and post-traumatic stress disorders relating to their experience in online violence. This issue is not a marginal or a light matter but a rising concern that is threatening women's safety, voice,participation,and rights. This highlights the urgent need for stronger legal responses, better institutional support, and stricter legal liability from companies whose platforms are escalating infringement.

Non-Consensual Synthetic Intimate Imagery (NSII)

One of the most prevalent abuses of deepfake is the creation of sexual content, which spreads widely across the internet. AI generated NSII is more known as deepfake pornography. The term deepfakes began in late 2017 on Reddit, after a user named deepfakes posted NSII of celebrities on to pornographic videos. The continued consumer interests in deepfakes led to more deepfake sites, often depicting celebrities. NSII is a clear form of image based sexual abuse because intimate images are created and shared without consent. The expansion of NSII technologies means that anyone can be the victim of image-based pornography. Sexual extortion is another form of NSII. Sextortion constitutes a digital blackmail where someone tricks others into sending explicit images, followed by threats to

share the image to the public unless the extortionist's demands are fulfilled. Offenders commonly target their victims through dating apps, social media or webcams.

Structural Data Bias

Structural data bias in AI is the distortion of information within training datasets. It can occur through the steps of collecting data, preprocessing, or from biases in human behavior that were captured in the data. This can lead to errors in predictions or decision making led by the AI system. For example, if a diagnostic AI model is trained on data mainly from a certain targeted group, then it may fail to correctly recognize the symptoms and make wrong diagnoses for individuals that are not a part of that group. To prevent structural data bias it is important to detect algorithms or information that shows structurally biased behaviours and change it as fast as possible because if the bias of the algorithm continues, it risks automating and amplifying societal inequalities through a self reinforcing feedback loop. Consequently, the flaws will be deeply embedded, making the predictions of the model degrade and making it harder to correct over time.

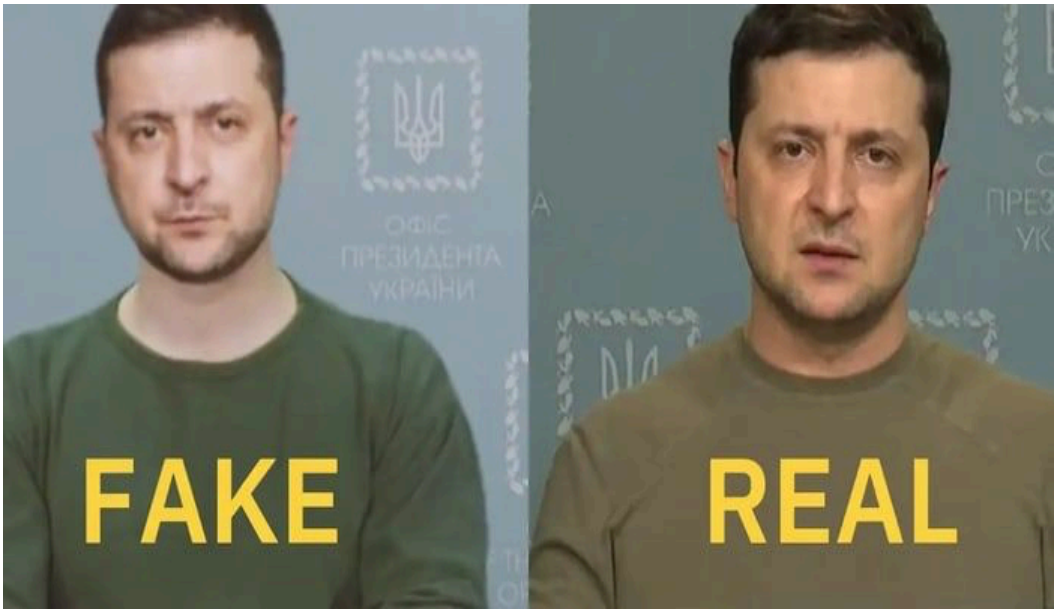

International Crisis and Issues

On May 22, 2023 an AI generated image of a large explosion with black smoke near the U.S Pentagon was released widely on social media. Many people were in panic however, in reality the U.S department of defense and the Arlington Fire department announced that no such explosion had happened, declaring the image to be fake and misleading. The appearance of one fake image caused not only U.S citizens in confusion, but many other countries in international chaos.

The fake Pentagon explosion is assumed to be AI-generated. (Image: Twitter/@WhaleChart) (Channel News Asia, 2023)

In 2022, March, a group of hackers hacked the TV broadcast and the official website of Ukraine 24 and released a video of Volodymyr Zelenskyy(the president of Ukraine) standing at a podium stating the citizens of Ukraine and the soldiers to lay down the weapons because he has decided to hand over the land of Donbas and end the war. Within a few minutes after the dissemination of the video, president Zelenskyy published a self recorded video on Telegram declaring that Ukraine will not surrender under any circumstances until they have won the war. This swift response neutralized the psychological warfare before it could have triggered frontline chaos.

Deepfake President Zelensky calls on Ukraine to surrender, as TV station hacked (Bitdefender, 2022)

In 2023, September, just 2 days before the Slovak parliamentary election, a deepfake audio of Michal Simecka (the leader of the pro western progressive party) discussing election rigging and raising the prices of beer was released. Slovak law mandates a mandatory moratorium right before an election which prohibits campaigns and counter statements. The election concluded with the victory of the pro Russian party, disrupting the unified EU and NATO regarding military aid to Ukraine. This event shows how one artificially made audio or video can influence the whole country changing the results of the presidential election. It shows how easily people get deceived by AI videos and how one country's governmental structure could be altered entirely with one release of an AI-generated video.

A candidate targeted by a deepfake has an AI warning for America (CNN politics, 2024)

International Responses and Governance Frameworks

Responses to the growth in deepfakes are occurring on several fronts. Many digital and online platforms(such as Facebook, Instagram, Tiktok,X and Youtube) have started implementing disclosure policies that require advertisements using AI-created content to be labeled. Other globally known tech companies are banning certain types of synthetic material, creating training resources to assist in combating these images and working on ways to embed content with tags to confirm authenticity. News organizations have been trying to develop online training courses to assist with identifying deepfakes.

The UN has been relentlessly trying to implement actions in order to deal with AI violence in human rights and privacy. The UN has announced in A/HRC/48/31 the actions that should be taken by high commissioners for the right of privacy in the digital age. The UN calls for high commissioners for a moratorium on the sale and usage of AI systems that could pose serious risk to human rights until adequate safeguards are made. Also, AI applications that will not be in compliance with the international human rights law would be banned. It is also stated that states should immediately place a moratorium on the use of remote biometric identification technology in publicly accessible spaces. Apart from the UN, the EU(European Union) is providing AI regulation and guidelines to protect the citizens from crimes that happen online and to create a standardized criteria of AI for companies making a safer AI society. The EU is calling for AI marks on AI generated synthetic audio,images and videos so people can easily detect whether the content is made by AI or not.

The Enforcement Gap

Even with the efforts to ensure the rights of privacy and safety in online platforms, there are limits that are holding these legal frameworks from actually protecting the citizens. The updates and the development of AI technology only take a few months to be conducted. However, compared to the speed of AI, it takes 2 to 5 years for the UN's resolution to be approved and implemented to the nations in UN. Another limitation is the characteristics of borderless nature in digital violence. When the data server, the developer of the software, the suspect, and the victim are all located in different nations, it is difficult to clearly distinguish which nation is in charge of judicial sovereignty, raising the tensions between these nations and not being able to solve the crime.

Possible solutions

The UN Cybercrime Convention

This convention is a global treaty adopted by the UN for cross border investigations and digital evidence gathering for online crimes. Currently, it is providing a legal framework for police in one country to request data concerning online crimes from another country when dealing with cybercriminals. The traditional legal request takes a few months between the nations. This convention operates an emergency 24 hour protocol for immediate access while the investigation is ongoing. The core function of the convention is that it requires all signatory nations to domestically pass laws penalizing non consensual distribution of intimate images. This eliminates legal loopholes for deepfakes and digital sex crimes.

Safety by Design Protocols and Cross Platform Hashing Infrastructure

This is a global system started in the UK where big tech companies such as Meta, Tiktok, and Google work together. When a victim fears their private photos may leak, they upload them to a secure portal. Then the system instantly converts the file into a unique string of numbers called a perceptual Hash, also known as photo DNA, and it immediately prevents the original file from being found on the internet, protecting the victim's privacy. This allows real time prevention of misleading photos and videos because when a user tries to upload the same video or photo, the platform's server checks if it has the same Hash and blocks it automatically before anyone sees it.

However, as this system relies on voluntary corporate engagement, non compliant platforms such as Telegram or other dark webs will refuse to join, creating a big security loophole. Also, Generative AI tools can easily alter the images by adding minor filters and few pixels. These small changes can confuse the hashing algorithms causing chaos by bypassing the image.

Digital Services Act

The European Union has implemented a powerful law known as the Digital Services Act (DSA). If a platform such as X or Telegram ignores a deepfake report and fails to remove it within 24 hours, the company will have to face fines up to 6% of their total global annual revenue. The problem with this regulation is that currently it is only implemented in the European Union, so it is hard to

enforce the fines on other countries. High risk platforms can simply migrate their servers to countries outside European jurisdiction where digital enforcement laws are weak.

Standardizing the AI Watermarking Systems

This approach focuses on creating an industry wide technical standard for tracking digital contents. Led by C2PA (standing for Coalition for Content Provenance and Authenticity, it is an alliance of major tech companies that includes Microsoft, Google, Open AI and etc). The moment a photo or a video is captured by a smart camera to be generated by AI, the system automatically secures a mathematical signature into the file's background code stating that it is AI generated. In this way, users can easily detect whether the video they're consuming is AI or it is a real video preventing confusion as AI created films are highly advanced these days.

Major parties involved

Meta

Meta includes applications like Facebook and Instagram. They serve as the primary channels where digital violence spreads. They are responsible for implementing content moderation, monitoring the overall safety of the content, developing technological solutions such as developing AI filtering systems. While they face massive public pressure to protect users, they are more concerned about the financial costs and losses of over moderation and risks of accidentally censoring legitimate speech and content.

European Union

The EU positions itself as a global leader on human rights centric technology regulations.The EU values the accountability of the big tech companies, the legal liability, and imperative guidelines as their overriding priority. The EU's stance moves past viewing deepfakes as simple content moderation issues. Framing them instead as structural human rights violations and safety hazards. Driven by their protective ethos, the EU views the escalation of digital violence as a direct threat to civil liberties. The EU is moving toward a zero tolerance framework, where their goal is to use the DSA to force tech companies to take necessary actions. Rather than waiting for a crime to occur then solving the problem, the EU is making legal requirements for tech companies to redesign the systems to stop the spread of digital violence.

United States of America

USA has one of the most leading global generative AI companies such as Google, Open AI, Meta. The USA opposes strict regulations and government censorship, concerned that it stifles innovation and undermines freedom of expression. Instead, the USA wants to focus on advocating voluntary industry ethics guidelines and tech driven solutions. From the USA's perspective, American policy makers see AI not as a system that should be regulated, but instead as a critical development for economic growth and national security. Rather than implementing a single federal framework like the EU, the USA is more open to voluntary commitments from the industry itself. The ultimate goal is to secure its dominant position at the frontier of technology ensuring that safety concerns are taken care of dynamically through innovation. The Take It Down Act is a federal law in the U.S.A. It

ensures that unauthorized sharing of AI deepfake pornography is forced to be deleted from media platforms within 48 hours. If they refuse to remove it, they will have to face heavy fines from the Federal Trade Commission (FTC).

People's Republic of China

China's stance stands on state led control and national security. China views unchecked gen AI and digital violence as a critical threat to China's social stability, keeping state sovereignty and public order. China will interfere actively to try restricting other media platforms that are going viral in China and prioritizing China's domestic media ecosystem. The Chinese government views the online spaces not as open marketplaces, but as critical frontiers for regime survival. Any algorithm, deepfake, or digital trend that bypasses government oversight will be treated as a direct threat to national security, risking social harmony. China's objective is to gain complete digital sovereignty through strict pre-screening programs and algorithmic alignment. China believes that AI and digital infrastructures should only be used and considered as a tool for social management.

Republic of Korea

The Republic of Korea is one of the nations that are facing severe deepfakes and online violence especially gender based digital crimes. ROK is keeping focus on revising sex crimes punishment acts and actively participates in discussions on platform accountability. To South Korea digital violence is not a futuristic risk, but an issue that requires urgent legislative intervention. Currently, the government recognized that traditional frameworks has limits as the speed and the anonymity of gen AI is growing at a rapid pace. To address this, South Korea is working on narrowing the gaps between technological development and victim protection.

Republic of India

As a nation with one of the largest internet user populations, India stands on safeguarding social harmony and digital sovereignty. India views unchecked gen AI as a fuse that can threaten public safety and internal security as well. India should be deeply cautious because they have a huge population. In India, a single convincing deepfake or an AI generated fake news about religion or politics can spread widely in just a few minutes. Often it can lead to actual riots, mob violence, and deaths on the streets before the truth can be verified. India should work on enforcing strict data

localization and make sure that companies like Meta, Google and other platforms can be held legally responsible in the Indian court if a harmful trend goes viral.

Timeline Of Events

September 2019, The world's first deepfake ban laws passes	Texas made it illegal to use political deepfakes before an election and California passed a law letting victims of non consensual deepfake sue the abusers.
March 2020, Republic of Korea cracks down on deepfake sex crimes	After a massive telegram scandal broke, the national parliament added Article 14-2 to their sexual violence punishment act.
November 2021, UNESCO's global AI ethics guidelines pass	193 member states at UNESCO agreed on the first global standard for AI ethics
March 2022, Ukraine 24 TV releases president Zelenskyy Surrendering Deepfake video	Hackers hacked into the Ukrainian news broadcasting a deepfake video of President Zelenskyy ordering troops to surrender. Right after the deepfake was released, Zelenskyy posted a self-recorded video on Telegram neutralizing the psychological warfare before it could trigger frontline chaos.
January 2023, Mandatory watermarking law passes in the People's Republic of China	China's internet regulator enforced new Deep Synthesis Management Provisions.
May 2023, Viral Pentagon Explosion Fake Image released to the public	An AI generated image of an explosion near the U.S. Pentagon went viral on social media. Despite quick denials from defense officials, the deepfake triggered national confusion and a temporary drop in the U.S. stock market.
September 2023, Slovakia Election Rigging Deepfake Audio Sabotage released	Just two days before the Slovak parliamentary election, a deepfake audio of progressive leader Michal Simecka discussing election rigging was released during a mandatory media blackout. Resulting in the victory of the pro-Russian party and disrupting EU and NATO unity on Ukraine aid.
October 2023, United StatesPresident Biden issues an AI executive order	President Biden of the USA signed executive order 14110 to deal with AI safety and the deepfake.
November 2023, UK AI Safety Summit and Bletchley Declaration come into force	The UK hosted the first global AI Safety Summit at Bletchley Park, which brought together 28 nations and major tech giants. Participants signed the Bletchley Declaration, acknowledging the potential risks that could occur from AI.
January 2024, Taylor Swift deepfake scandals	AI generated explicit images of Taylor Swift

spreads	were posted on X (Twitter), pushing the US congress of Defiance Act to protect deepfake victims.
March 2024, UN General Assembly Passes its first AI Resolution	The UNGA unanimously passed Resolution A/RES/78/265 sponsored by the US and over 120 countries, calling out dangerous AI misuses.
March 2024, EU Parliament Passes the Artificial Intelligence Act	The European Parliament officially approved the AI Act, creating the world's first comprehensive legal framework to regulate AI systems. Heavily restricting surveillance and deepfake abuses.
May 2024, Republic of Korea Korea Hosts AI Seoul Summit	Co-hosted by the Republic of Korea and the UK, the summit gathered world leaders and tech CEOs to sign the Seoul Declaration, shifting the global focus toward building safe and innovative AI ecosystems.
July 2024, UNHRC labels deepfake sex crimes as a human rights violation	The UNHRC adopted resolution 56/L.8 on technology assisted gender violence. Recognizing that AI porns as a serious gender based violence.
September 2024, the Council of Europe AI Treaty for Signatures opens	The Framework Convention on Artificial Intelligence became open for signature in Vilnius. Over 30 nations, including EU states, the US, and the UK, signed the first legally binding international treaty to align AI development with human rights.
September 2024, First legally binding international AI treaty is signed	Nations across Europe and the UK,US,and Israel signed the Council of Europe's Framework Convention on AI.
2025-2026, Global election years and penalizing Electoral deepfakes	Countries worldwide faced major elections seeing political deepfakes throughout the elections. Election courts and parliaments worldwide passed emergency bans, officially treating deceptive political deepfakes as threat to democracy and national security.

UN Involvement, Resolutions, Treaties and Events

UN Convention Against Cybercrime, 2024-2025

- Recommends all member states to criminalize the unauthorized creation and dissemination of explicit digital media, creating a binding framework for prosecuting deepfake abuse.

- UN General Assembly Resolution 78/265, MARCH 2024

- Affirms that human rights apply identically online and offline, barring any AI system that infringes on fundamental freedoms.

- UN Global Digital Compact, SEPTEMBER 2024

- Sets global goals to combat synthetic disinformation and digital violence. While urging adoption of technical standards like digital watermarking, metadata tagging, and content provenance to trace deepfakes.

- UNESCO Recommendation on the Ethics of AI, 2021

- Recommends states to combat algorithmic bias and gendered violence in training datasets. Recommending mandatory human rights impact assessments before deploying public generative AI models.

- International Covenant on Civil and Political Rights,1966

- The fundamental legal basis for prohibiting non consensual deepfakes, identity theft, and unauthorized digital impersonation. Limiting harmful synthetic media while preventing over regulation or state censorship.

- UN Human Rights Council Resolution 56/4, JULY 2024

- Explicitly recognizes technology-facilitated gender-based violence, including AI-generated deepfakes, as a severe violation of human rights. It urges all member states to develop robust national legislation to criminalize the unauthorized creation and distribution of synthetic explicit media.

- UN General Assembly Resolution 78/311, JULY 2024

- Dedicated to protecting human rights in the digital environment. It calls upon tech platforms to enforce stricter accountability measures and urges international cooperation to combat AI-driven digital violence, cyberbullying, and hate speech without undermining the freedom of expression.

- Council of Europe Framework Convention on Artificial Intelligence, SEPTEMBER 2024

- Establishes the first legally binding international treaty aimed at ensuring that AI systems strictly respect human rights, democratic values, and the law. It mandates signatory nations to implement legal remedies against digital harms and deepfake abuses that threaten democratic processes.

- UN Women Strategy on Preventing and Eliminating Technology-Facilitated Violence,, DECEMBER 2025

- Aligns with the UN Women Strategic Plan to establish a human rights-based, gender-responsive vision for digital transformation. It defines technology-facilitated violence as a continuous violation of human rights and outlines a global response to hold technology developers strictly accountable.

- UN Human Rights Council Advisory Committee Study on TFGBV, SEPTEMBER 2026

- A milestone expert study tracking the global explosion of AI-powered automated harassment and deepfakes. The report officially advocates for enforceable regulations on the technology industry to protect marginalized groups, women journalists, and politicians from digital erasure.

- UN Security Council Resolution 2832, OCTOBER 2026

- Addresses emerging digital risks and technology-facilitated gender-based violence within conflict-affected settings. It establishes international mechanisms to monitor how synthetic media and digital tracking technologies harm women and girls in vulnerable regions.
